Questions?

Table of Contents

1. Associative Arrays

- HashMap <key, value>
- LinkedHashMap <key, value>
- TreeMap <key, value>
- 2. Lambda
- 3. Stream API
 - Filtering
 - Mapping
 - Ordering

Associative Arrays

Collection of Key and Value Pairs

Associative Arrays (Maps)

Associative arrays are arrays indexed by keys

Not by the numbers 0, 1, 2, ... (like arrays)

■ Hold a set of pairs {key → value}

Key	Value
John Smith	+1-555-8976
Lisa Smith	+1-555-1234
Sam Doe	+1-555-5030
	11 333 3030

Collections of Key and Value Pairs

- HashMap<K, V>
 - Keys are unique
 - Uses a hash-table + list
- LinkedHashMap<K, V>
 - Keys are unique
 - Keeps the keys in order of addition
- TreeMap<K, V>
 - Keys are unique
 - Keeps its keys always sorted
 - Uses a balanced search tree

Built-In Methods

put(key, value) method

```
HashMap<String, Integer> airplanes = new HashMap<>();
airplanes.put("Boeing 737", 130);
airplanes.put("Airbus A320", 150);
```

remove(key) method

```
HashMap<String, Integer> airplanes = new HashMap<>();
airplanes.put("Boeing 737", 130);
airplanes.remove("Boeing 737");
```

Built-In Methods

containsKey(key)

```
HashMap<String, Integer> map = new HashMap<>();
map.put("Airbus A320", 150);
if (map.containsKey("Airbus A320"))
    System.out.println("Airbus A320 key exists");
```

containsValue(value)

```
HashMap<String, Integer> map = new HashMap<>();
map.put("Airbus A320", 150);
System.out.println(map.containsValue(150)); //true
System.out.println(map.containsValue(100)); //false
```

HashMap: Put()

Peter	0881-123-987
George	0881-123-789
Alice	0881-123-978

Hash Function

HashMap<String, String>

Key Value

HashMap: Remove()

Hash Function

HashMap<String, String>

Peter	0881-123-987
George	0881-123-789
Alice	0881-123-978

Key Value

TreeMap<K, V> - Example

Peter 0881-123-987

Alice +359-899-55-592

Comparator Function

TreeMap <String>

Key Value

Iterating Through Map

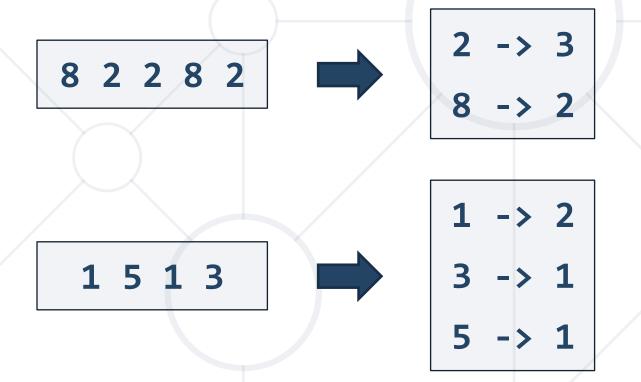

- Iterate through objects of type Map. Entry<K, V>
- Cannot modify the collection (read-only)

entry.getKey() -> fruit name
entry.getValue() -> fruit price

Problem: Count Real Numbers

 Read a list of real numbers and print them in ascending order along with their number of occurrences

Solution: Count Real Numbers

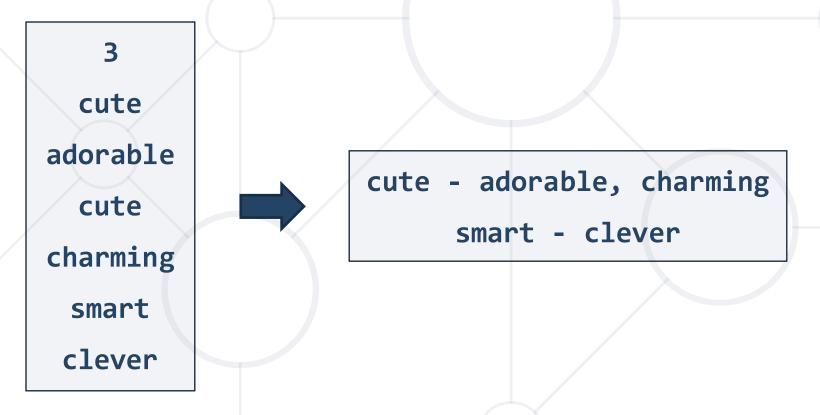

```
double[] nums = Arrays.stream(sc.nextLine().split(" "))
                .mapToDouble(Double::parseDouble).toArray();
Map<Double, Integer> counts = new TreeMap<>();
for (double num : nums) {
 if (!counts.containsKey(num))
   counts.put(num, 0);
                                           Overwrite
 counts.put(num, counts.get(num) + 1);
                                            the value
for (Map.Entry<Double, Integer> entry : counts.entrySet()) {
 DecimalFormat df = new DecimalFormat("#.#####");
 System.out.printf("%s -> %d%n", df.format(entry.getKey()), entry.getValue());
```

Problem: Words Synonyms

- Read 2 * N lines of pairs word and synonym
- Each word may have many synonyms

Solution: Word Synonyms

```
int n = Integer.parseInt(sc.nextLine());
Map<String, ArrayList<String>> words = new LinkedHashMap<>();
for (int i = 0; i < n; i++) {
  String word = sc.nextLine();
                                               Adding the key if
  String synonym = sc.nextLine();
                                               it does not exist
  words.putIfAbsent(word, new ArrayList<>());
  words.get(word).add(synonym);
//TODO: Print each word and synonyms
```

Lambda Expressions

Anonymous Functions

Lambda Functions

 A lambda expression is an anonymous function containing expressions and statements

Lambda expressions

- Read as "goes to"
- The left side specifies the input parameters
- The right side holds the expression or statement

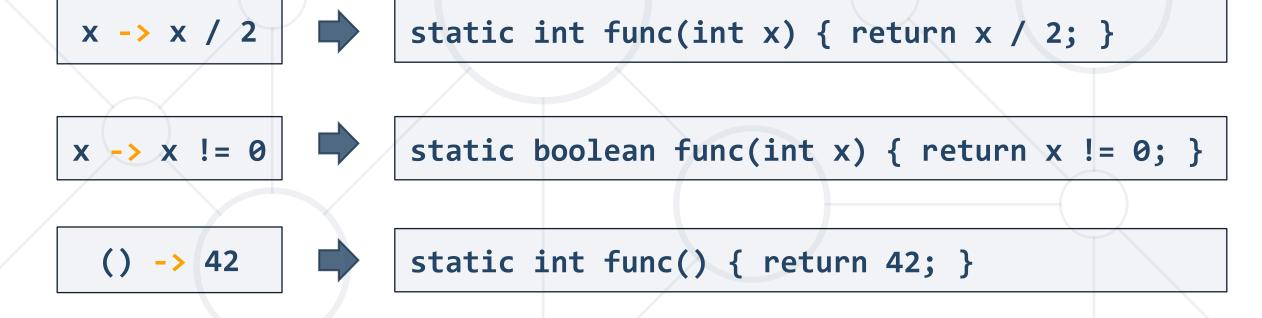

Lambda Functions

Lambda functions are inline methods (functions)
 that take input parameters and return values:

Traversing and Querying Collections

Processing Arrays with Stream API

min() - finds the smallest element in a collection: 15

```
int min = Arrays.stream(new int[]{15, 25, 35}).min().getAsInt();
```

```
int min = Arrays.stream(new int[]{15, 25, 35}).min().orElse(2);
```

```
int min = Arrays.stream(new int[]{}).min().orElse(2); // 2
```

max() - finds the largest element in a collection: 35

```
int max = Arrays.stream(new int[]{15, 25, 35}).max().getAsInt();
```

Processing Arrays with Stream API

sum() - finds the sum of all elements in a collection:

75

```
int sum = Arrays.stream(new int[]{15, 25, 35}).sum();
```

average() - finds the average of all elements:

25.0

Processing Collections with Stream API

```
ArrayList<Integer> nums = new ArrayList<>() {{
   add(15); add(25); add(35);
};
```

min()

15

Processing Collections with Stream API

max()

35

sum()

75

Processing Collections with Stream API

average()

Manipulating Collections

map() - manipulates elements in a collection:

Converting Collections

Using toArray(), toList() to convert collections:

Filtering Collections

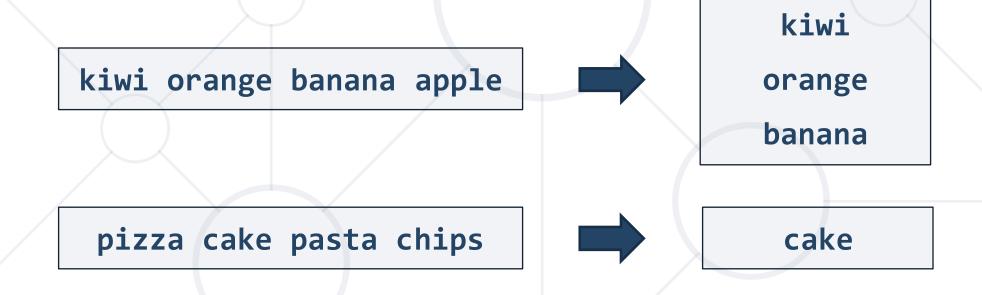

Using filter()

Problem: Word Filter

- Read a string array
- Print only words which length is even

Check your solution here: https://judge.softuni.org/Contests/1311/

Solution: Word Filter

```
String[] words = Arrays.stream(sc.nextLine().split(" "))
                .filter(w -> w.length() % 2 == 0)
                .toArray(String[]::new);
for (String word : words) {
  System.out.println(word);
```

Summary

- Maps hold {key -> value} pairs
 - Keyset holds a set of unique keys
 - Values hold a collection of values
 - Iterating over a map takes the entries as Map.Entry<K, V>
- Lambda and Stream API help collection processing
